Section G.3

How can we understand linear maps geometrically?

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

At the end of this module, students will be able to...

G1. Row operations. ... represent a row operation as matrix multiplication, and compute how the operation affects the determinant.

G2. Determinants. ... compute the determinant of a square matrix.

G3. Eigenvalues. ... find the eigenvalues of a 2×2 matrix.

G4. Eigenvectors. ... find a basis for the eigenspace of a square matrix associated with a given eigenvalue.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Calculate the area of a parallelogram.
- Find the matrix corresponding to a linear transformation of Euclidean spaces **A1**.
- Recall and use the definition of a linear transformation **A2**.
- Find all roots of quadratic polynomials (including complex ones).
- Interpret the statement "A is an invertible matrix" in many equivalent ways in different contexts.

Module G

Activity G.1.1 *(∼5 min)*

The image below illustrates how the linear transformation $T : \mathbb{R}^2 \to \mathbb{R}^2$ given by

the standard matrix $A = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}$ transforms the unit square.

$$A\mathbf{e}_2 = \begin{bmatrix} 0 \\ 3 \end{bmatrix}$$

$$A\mathbf{e}_1 = \begin{bmatrix} 2 \\ 0 \end{bmatrix}$$
(a) What are the lengths of $A\mathbf{e}_1$ and $A\mathbf{e}_2$?

(b) What is the area of the transformed unit square?

Activity G.1.2 *(∼5 min)*

The image below illustrates how the linear transformation $S : \mathbb{R}^2 \to \mathbb{R}^2$ given by the standard matrix $B = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix}$. transforms the unit square.

(a) What are the lengths of $B\mathbf{e}_1$ and $B\mathbf{e}_2$?

(b) What is the area of the transformed unit square?

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Observation G.1.3

It is possible to find two nonparallel vectors that are scaled but not rotated by the linear map given by B.

$$B\mathbf{e}_1 = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} = 2\mathbf{e}_1$$

$$B \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$
The process for finding such vectors will be covered later in this module.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Observation G.1.4

Notice that while a linear map can transform vectors in various ways, linear maps always transform parallelograms into parallelograms, and these areas are always transformed by the same factor: in the case of $B = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix}$, this factor is 8.

$$B\mathbf{e}_2 = \begin{bmatrix} 3 \\ 4 \end{bmatrix}$$

$$B\mathbf{e}_1 = \begin{bmatrix} 2 \\ 0 \end{bmatrix}$$

$$B \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$

$$B \begin{bmatrix} 1 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$
Since this change in area is always the same for a given linear map, it will be equal to the value of the transformed unit square (which begins with area 1).

Section G.3

Definition G.1.10

The **determinant** is the unique function $\det : M_{n,n} \to \mathbb{R}$ satisfying these properties:

P1: $\det(I) = 1$

P2: $\det(A) = 0$ whenever two columns of the matrix are identical.
P3: $\det[\cdots \ c\mathbf{v} \ \cdots] = c \det[\cdots \ \mathbf{v} \ \cdots]$, assuming no other columns change.

P4: $\det[\cdots \ \mathbf{v} + \mathbf{w} \ \cdots] = \det[\cdots \ \mathbf{v} \ \cdots] + \det[\cdots \ \mathbf{w} \ \cdots]$, assuming no other columns change.

Note that these last two properties together can be phrased as "The determinant is linear in each column."

Module G

Math 237

Module G

Section G.1
Section G.2
Section G.3

Observation G.1.11

The determinant must also satisfy other properties. Consider $\det([\mathbf{v} \quad \mathbf{w} + c\mathbf{v}])$ and $\det([\mathbf{v} \quad \mathbf{w}])$.

The base of both parallelograms is $\mathbf{v}$, while the height has not changed, so the determinant does not change either. This can also be proven using the other properties of the determinant:

$$\begin{aligned}
\det([\mathbf{v} + c\mathbf{w} \quad \mathbf{w}]) &= \det([\mathbf{v} \quad \mathbf{w}]) + \det([c\mathbf{w} \quad \mathbf{w}]) \\
&= \det([\mathbf{v} \quad \mathbf{w}]) + c \det([\mathbf{w} \quad \mathbf{w}]) \\
&= \det([\mathbf{v} \quad \mathbf{w}]) + c \cdot 0 \\
&= \det([\mathbf{v} \quad \mathbf{w}])
\end{aligned}$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Observation G.1.12

Columns may be swapped by adding/subtracting columns from one another, which we've just seen doesn't change the determinant.

$$
\begin{aligned}
\det([\mathbf{v} \quad \mathbf{w}]) &= \det([\mathbf{v} + \mathbf{w} \quad \mathbf{w}]) \\
&= \det([\mathbf{v} + \mathbf{w} \quad \mathbf{w} - (\mathbf{v} + \mathbf{w})]) \\
&= \det([\mathbf{v} + \mathbf{w} \quad -\mathbf{v}]) \\
&= \det([\mathbf{v} + \mathbf{w} - \mathbf{v} \quad -\mathbf{v}]) \\
&= \det([\mathbf{w} \quad -\mathbf{v}]) \\
&= -\det([\mathbf{w} \quad \mathbf{v}])
\end{aligned}
$$

So swapping two columns results in a negation of the determinant. Therefore, determinants represent a *signed* area, since they are not always positive.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Remark G.1.13

Swapping columns may be thought of as a reflection, which is represented by a negative determinant. For example, the following matrices transform the unit square into the same parallelogram, but the second matrix reflects its orientation.

$$A = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \qquad B = \begin{bmatrix} 3 & 2 \\ 4 & 0 \end{bmatrix}$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Fact G.1.14

To summarize, we've shown that the column versions of the three row-reducing operations a matrix may be used to simplify a determinant in the following way:

(a) Multiplying a column by a scalar multiplies the determinant by that scalar:

$$c \det([\cdots \ \mathbf{v} \ \cdots]) = \det([\cdots \ c\mathbf{v} \ \cdots])$$

(b) Swapping two columns changes the sign of the determinant:

$$\det([\cdots \ \mathbf{v} \ \cdots \ \mathbf{w} \ \cdots]) = -\det([\cdots \ \mathbf{w} \ \cdots \ \mathbf{v} \ \cdots])$$

(c) Adding a multiple of a column to another column does not change the determinant:

$$\det([\cdots \ \mathbf{v} \ \cdots \ \mathbf{w} \ \cdots]) = \det([\cdots \ \mathbf{v} + c\mathbf{w} \ \cdots \ \mathbf{w} \ \cdots])$$

Remark G.2.1

Recall that the column versions of the three row-reducing operations a matrix may be used to simplify a determinant:

(a) Multiplying columns by scalars:

$$\det([\cdots \ c\mathbf{v} \ \cdots]) = c \det([\cdots \ \mathbf{v} \ \cdots])$$

(b) Swapping two columns:

$$\det([\cdots \ \mathbf{v} \ \cdots \ \mathbf{w} \ \cdots]) = -\det([\cdots \ \mathbf{w} \ \cdots \ \mathbf{v} \ \cdots])$$

(c) Adding a multiple of a column to another column:

$$\det([\cdots \ \mathbf{v} \ \cdots \ \mathbf{w} \ \cdots]) = \det([\cdots \ \mathbf{v} + c\mathbf{w} \ \cdots \ \mathbf{w} \ \cdots])$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Remark G.2.2

The determinants of row operation matrices may be computed by manipulating columns to reduce each matrix to the identity:

- Scaling a row: $\det \begin{bmatrix} c & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = c \det \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = c$

- Swapping rows: $\det \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} = -1 \det \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = -1$

- Adding a row multiple to another row:
  $\det \begin{bmatrix} 1 & 0 & c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \det \begin{bmatrix} 1 & 0 & c - 1c \\ 0 & 1 & 0 - 0c \\ 0 & 0 & 1 - 0c \end{bmatrix} = \det(I) = 1$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Fact G.2.3

Thus we can also use row operations to simplify determinants:

1. Multiplying rows by scalars: $\det \begin{bmatrix} \vdots \\ cR \\ \vdots \end{bmatrix} = c \det \begin{bmatrix} \vdots \\ R \\ \vdots \end{bmatrix}$

2. Swapping two rows: $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = -\det \begin{bmatrix} \vdots \\ S \\ \vdots \\ R \\ \vdots \end{bmatrix}$

3. Adding multiples of rows to other rows: $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = \det \begin{bmatrix} \vdots \\ R + cS \\ \vdots \\ S \\ \vdots \end{bmatrix}$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Observation G.2.4

So we may compute the determinant of $\begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix}$ by manipulating its rows/columns to reduce the matrix to I:

$$
\begin{aligned}
\det \begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix} &= 2 \det \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \\
&= 2 \det \begin{bmatrix} 1 & 2 \\ 2 - 2(1) & 3 - 2(2) \end{bmatrix} = 2 \det \begin{bmatrix} 1 & 2 \\ 0 & -1 \end{bmatrix} \\
&= 2(-1) \det \begin{bmatrix} 1 & -2 \\ 0 & +1 \end{bmatrix} = -2 \det \begin{bmatrix} 1 & -2 \\ 0 & 1 \end{bmatrix} \\
&= -2 \det \begin{bmatrix} 1 + 2(0) & -2 + 2(1) \\ 0 & 1 \end{bmatrix} = -2 \det \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\
&= -2 \det I = -2(1) = -2
\end{aligned}
$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Remark G.2.5

While a formula might make this 2×2 determinant easier, memorizing a formula for 3×3, 4×4, or larger determinants is difficult. So we will start by focusing on how to use row/column operations on 3×3 determinants.

But rather than always turning the original matrix into I, let's figure out how to turn the determinant of a larger matrix into the determinant of a smaller matrix.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Activity G.2.6 *(∼5 min)*

The following image illustrates the transformation of the unit cube by the matrix

$$\begin{bmatrix} 3 & 1 & 0 \\ 1 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix}.$$
Recall that for this solid $V = Bh$, where h is the height of the solid and B is the area of its parallelogram base. So what must its volume be?

(a) $\det \begin{bmatrix} 3 & 1 \\ 1 & 1 \end{bmatrix}$ (b) $\det \begin{bmatrix} 3 & 1 \\ 1 & 0 \end{bmatrix}$ (c) $\det \begin{bmatrix} 3 & 1 \\ 0 & 1 \end{bmatrix}$ (d) $\det \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Fact G.2.7

If row i contains all zeros except for a 1 on the main (upper-left to lower-right) diagonal, then both column and row i may be removed without changing the value of the determinant.

$$\det \begin{bmatrix} 3 & 2 & -1 & 3 \\ 0 & 1 & 0 & 0 \\ -1 & 4 & 1 & 0 \\ 5 & 0 & 11 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 3 \\ -1 & 1 & 0 \\ 5 & 11 & 1 \end{bmatrix}$$

Since row and column operations affect the determinants in the same way, the same technique works for a column of all zeros except for a 1 on the main diagonal.

$$\det \begin{bmatrix} 3 & 0 & -1 & 5 \\ 2 & 1 & 4 & 0 \\ -1 & 0 & 1 & 11 \\ 3 & 0 & 0 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 5 \\ -1 & 1 & 11 \\ 3 & 0 & 1 \end{bmatrix}$$

Section G.2
Section G.3

Observation G.2.13

Another option is to take advantage of the fact that the determinant is linear in each row or column. This approach is called **Laplace expansion** or **cofactor expansion**.

For example, since $\begin{bmatrix} 1 & 2 & 4 \end{bmatrix} = 1\begin{bmatrix} 1 & 0 & 0 \end{bmatrix} + 2\begin{bmatrix} 0 & 1 & 0 \end{bmatrix} + 4\begin{bmatrix} 0 & 0 & 1 \end{bmatrix}$,

$$\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 1 & 2 & 4 \end{bmatrix} = 1\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 1 & 0 & 0 \end{bmatrix} + 2\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 1 & 0 \end{bmatrix} + 4\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= -1\det \begin{bmatrix} 5 & 3 & 2 \\ 5 & 3 & -1 \\ 0 & 0 & 1 \end{bmatrix} - 2\det \begin{bmatrix} 2 & 5 & 3 \\ -1 & 5 & 3 \\ 0 & 0 & 1 \end{bmatrix} + 4\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= -\det \begin{bmatrix} 5 & 3 \\ 5 & 3 \end{bmatrix} - 2\det \begin{bmatrix} 2 & 5 \\ -1 & 5 \end{bmatrix} + 4\det \begin{bmatrix} 2 & 3 \\ -1 & 3 \end{bmatrix}$$

Observation G.2.14

Applying Laplace expansion to a 2×2 matrix yields a short formula:

$$\det \begin{bmatrix} a & b \\ c & d \end{bmatrix} = a \det \begin{bmatrix} 1 & 0 \\ c & d \end{bmatrix} + b \det \begin{bmatrix} 0 & 1 \\ c & d \end{bmatrix} = a \det \begin{bmatrix} 1 & 0 \\ c & d \end{bmatrix} - b \det \begin{bmatrix} 1 & 0 \\ d & c \end{bmatrix} = ad - bc.$$

There are formulas for the determinants of larger matrices, but they can be pretty tedious to use. For example, writing out a formula for a 4×4 determinant would require 24 different terms!

$$\det \begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{bmatrix} = a_{11}(a_{22}(a_{33}a_{44} - a_{43}a_{34}) - a_{23}(a_{32}a_{44} - a_{42}a_{34}) + \ldots) + \ldots$$

So this is why we either use Laplace expansion or row/column operations directly.

Section G.3

Fact G.3.2

- For every invertible matrix M,

$$\det(M)\det(M^{-1}) = \det(I) = 1$$

so $\det(M^{-1}) = \frac{1}{\det(M)}$.

- Furthermore, a square matrix M is invertible if and only if $\det(M) \neq 0$.

Observation G.3.3

Consider the linear transformation $A : \mathbb{R}^2 \to \mathbb{R}^2$ given by the matrix $A = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix}$.

It is easy to see geometrically that

$$A \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

It is less obvious (but easily checked once you find it) that

$$A \begin{bmatrix} 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 6 \\ 3 \end{bmatrix} = 3 \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Definition G.3.4

Let $A \in M_{n,n}$. An **eigenvector** for A is a vector $\mathbf{x} \in \mathbb{R}^n$ such that $A\mathbf{x}$ is parallel to $\mathbf{x}$.
In other words, $A\mathbf{x} = \lambda\mathbf{x}$ for some scalar λ. If $\mathbf{x} \neq \mathbf{0}$, then we say $\mathbf{x}$ is a **nontrivial eigenvector** and we call this λ an **eigenvalue** of A.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Activity G.3.5 *(∼5 min)*
Finding the eigenvalues λ that satisfy

$$A\mathbf{x} = \lambda\mathbf{x} = \lambda(I\mathbf{x}) = (\lambda I)\mathbf{x}$$

for some nontrivial eigenvector $\mathbf{x}$ is equivalent to finding nonzero solutions for the matrix equation

$$A\mathbf{x} - (\lambda I)\mathbf{x} = \mathbf{0}.$$

Which of the following must be true for any eigenvalue?

(a) The kernel of the transformation with standard matrix $A - \lambda I$ must contain the zero vector, so $A - \lambda I$ is invertible.

(b) The kernel of the transformation with standard matrix $A - \lambda I$ must contain a nonzero vector, so $A - \lambda I$ is not invertible.

(c) The image of the transformation with standard matrix $A - \lambda I$ must contain the zero vector, so $A - \lambda I$ is invertible.

(d) The image of the transformation with standard matrix $A - \lambda I$ must contain a nonzero vector, so $A - \lambda I$ is invertible.

Module G

Math 237

Module G

Section G.3

Fact G.3.6

The eigenvalues λ for a matrix A are the values that make $A - \lambda I$ non-invertible.

Thus the eigenvalues λ for a matrix A are the solutions to the equation

$$\det(A - \lambda I) = 0.$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3

Definition G.3.7

The expression $\det(A - \lambda I)$ is called **characteristic polynomial** of A.

For example, when $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$, we have

$$A - \lambda I = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} = \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix}$$

Thus the characteristic polynomial of A is

$$\det \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix} = (1 - \lambda)(4 - \lambda) - (2)(3) = \lambda^2 - 5\lambda - 2$$

and its eigenvalues are the solutions to $\lambda^2 - 5\lambda - 2 = 0$.
