Module G: Geometry of Linear Maps

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

How can we understand linear maps geometrically?

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

At the end of this module, students will be able to...

G1. Row operations. ... represent a row operation as matrix multiplication, and compute how the operation affects the determinant.

G2. Determinants. ... compute the determinant of a square matrix.

G3. Eigenvalues. ... find the eigenvalues of a 2×2 matrix.

G4. Eigenvectors. ... find a basis for the eigenspace of a square matrix associated with a given eigenvalue.

Section G.4

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Calculate the area of a parallelogram.
- Find the matrix corresponding to a linear transformation of Euclidean spaces **A1**.
- Recall and use the definition of a linear transformation **A2**.
- Find all roots of quadratic polynomials (including complex ones).
- Interpret the statement "A is an invertible matrix" in many equivalent ways in different contexts.

Activity G.1.1 *(∼5 min)*

The image below illustrates how the linear transformation $T_1 : \mathbb{R}^2 \to \mathbb{R}^2$ given by the standard matrix $A_1 = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}$ transforms the unit square.

$$A_1 \mathbf{e}_2 = \begin{bmatrix} 0 \\ 3 \end{bmatrix}$$

$$A_1 \mathbf{e}_1 = \begin{bmatrix} 2 \\ 0 \end{bmatrix}$$

(a) What are the lengths of $A_1 \mathbf{e}_1$ and $A_2 \mathbf{e}_2$?

(b) What is the area of the transformed unit square?

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Activity G.1.2 *(∼5 min)*

The image below illustrates how the linear transformation $T_2 : \mathbb{R}^2 \to \mathbb{R}^2$ given by the standard matrix $A_2 = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix}$. transforms the unit square.

$$A_2\mathbf{e}_2 = \begin{bmatrix} 3 \\ 4 \end{bmatrix}$$

$$A_2\mathbf{e}_1 = \begin{bmatrix} 2 \\ 0 \end{bmatrix}$$
(a) What are the lengths of $A_1\mathbf{e}_1$ and $A_2\mathbf{e}_2$?

(b) What is the area of the transformed unit square?

Observation G.1.3

It is possible to find two nonparallel vectors that are scaled but not rotated by the linear map given by A_2.

$$A_2\mathbf{e}_1 = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} = 2\mathbf{e}_1$$

$$A_2 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$

$$A_2 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$

$$A_2 \begin{bmatrix} 1 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$
The process for finding such vectors will be covered later in this module.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Observation G.1.4

Notice that while a linear map can transform vectors in various ways, linear maps always transform parallelograms into parallelograms, and these areas are always transformed by the same factor: in the case of $A_2 = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix}$, this factor is 8.
Since this change in area is always the same for a given linear map, it will be equal to the value of the transformed unit square (which begins with area 1).

Section G.1
Section G.2
Section G.3
Section G.4

Definition G.1.10

The **determinant** is the unique function det : $M_{n,n} \to \mathbb{R}$ satisfying these properties:
P1: $\det(I) = 1$

P2: $\det(A) = 0$ whenever two columns of the matrix are identical.

P3: $\det[\cdots \ c\mathbf{v} \ \cdots] = c \det[\cdots \ \mathbf{v} \ \cdots]$, assuming no other columns change.

P4: $\det[\cdots \ \mathbf{v} + \mathbf{w} \ \cdots] = \det[\cdots \ \mathbf{v} \ \cdots] + \det[\cdots \ \mathbf{w} \ \cdots]$, assuming no other columns change.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Observation G.1.11

What happens if we had a multiple of one column to another?

The base of both parallelograms is **v**, while the height has not changed, so the determinant does not change either. This also follows from the properties of the determinant:

$$\det([\mathbf{v} + c\mathbf{w} \quad \mathbf{w}]) = \det([\mathbf{v} \quad \mathbf{w}]) + \det([c\mathbf{w} \quad \mathbf{w}])$$
$$= \det([\mathbf{v} \quad \mathbf{w}]) + c\det([\mathbf{w} \quad \mathbf{w}])$$
$$= \det([\mathbf{v} \quad \mathbf{w}]) + c \cdot 0$$
$$= \det([\mathbf{v} \quad \mathbf{w}])$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Observation G.1.12

Columns may be swapped by adding/subtracting columns from one another, which we've just seen doesn't change the determinant.

$$\begin{aligned}
\det([\mathbf{v} \quad \mathbf{w}]) &= \det([\mathbf{v} + \mathbf{w} \quad \mathbf{w}]) \\
&= \det([\mathbf{v} + \mathbf{w} \quad \mathbf{w} - (\mathbf{v} + \mathbf{w})]) \\
&= \det([\mathbf{v} + \mathbf{w} \quad -\mathbf{v}]) \\
&= \det([\mathbf{v} + \mathbf{w} - \mathbf{v} \quad -\mathbf{v}]) \\
&= \det([\mathbf{w} \quad -\mathbf{v}]) \\
&= -\det([\mathbf{w} \quad \mathbf{v}])
\end{aligned}$$

So swapping two columns results in a negation of the determinant. Therefore, determinants represent a *signed* area, since they are not always positive.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.1.13

We've shown that the column versions of the three row-reducing operations a matrix may be used to simplify a determinant:

(a) Multiplying a column by a scalar multiplies the determinant by that scalar:

$$c \det([\cdots \quad \mathbf{v} \quad \cdots]) = \det([\cdots \quad c\mathbf{v} \quad \cdots])$$

(b) Swapping two columns changes the sign of the determinant:

$$\det([\cdots \quad \mathbf{v} \quad \cdots \quad \mathbf{w} \quad \cdots]) = -\det([\cdots \quad \mathbf{w} \quad \cdots \quad \mathbf{v} \quad \cdots])$$

(c) Adding a multiple of a column to another column does not change the determinant:

$$\det([\cdots \quad \mathbf{v} \quad \cdots \quad \mathbf{w} \quad \cdots]) = \det([\cdots \quad \mathbf{v} + c\mathbf{w} \quad \cdots \quad \mathbf{w} \quad \cdots])$$

Section G.4

Activity G.1.14 *(∼5 min)*

The transformation given by the standard matrix A scales areas by 4, and the transformation given by the standard matrix B scales areas by 3. How must the transformation given by the standard matrix AB scale areas?

(a) 1

(b) 7

(c) 12

(d) Cannot be determined

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.1.15

Since the transformation given by the standard matrix AB is obtained by applying the transformations given by A and B, it follows that

$$\det(AB) = \det(A)\det(B)$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Remark G.1.16

Recall that row operations may be produced by matrix multiplication.

- $\begin{bmatrix} c & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$: multiply the first row of A by c.

- $\begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$: swap the first and second row of A.

- $\begin{bmatrix} 1 & 0 & c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$: add c times the third row to the first row of A

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.1.17

Row operation matrix determinants may be computed by manipulating columns to reduce each matrix to the identity:

- $\det \begin{bmatrix} c & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = c \det \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = c$

- $\det \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} = -1 \det \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = -1$

- $\det \begin{bmatrix} 1 & 0 & c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \det \begin{bmatrix} 1 & 0 & c-c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = 1$

Section G.3
Section G.4

Fact G.2.1

Since the row operation matrices may be obtained with column operations, we can also use row operations to simplify determinants.

1. Multiplying rows by scalars: $\det \begin{bmatrix} \vdots \\ cR \\ \vdots \end{bmatrix} = c \det \begin{bmatrix} \vdots \\ R \\ \vdots \end{bmatrix}$

2. Swapping two rows: $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = -\det \begin{bmatrix} \vdots \\ S \\ \vdots \\ R \\ \vdots \end{bmatrix}$

3. Adding multiples of rows to other rows: $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = \det \begin{bmatrix} \vdots \\ R + cS \\ \vdots \\ S \\ \vdots \end{bmatrix}$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Definition G.2.2

The **transpose** of a matrix is given by rewriting its columns as rows and vice versa:

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.2.3

Since row and column operations both affect determinants the same way, the determinant of a matrix and its transpose are the same. For example, let $A = \begin{bmatrix} 3 & 3 \\ 0 & 2 \end{bmatrix}$, so $A^T = \begin{bmatrix} 3 & 0 \\ 3 & 2 \end{bmatrix}$; both matrices scale the unit square by 6, even though the parallelograms are not congruent.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Activity G.2.4 *(∼10 min)*

Compute the determinant of $\begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix}$ by row reducing it to a nicer matrix.

For example, $\det \begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix} = 2 \det \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix}$.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.2.5

This same process allows us to prove a more convenient formula:
$$\det \begin{bmatrix} a & b \\ c & d \end{bmatrix} = ad - bc$$

In higher dimensions, the formulas become unreasonable. For example, the formula for 4×4 matrices has 24 terms!

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Activity G.2.6 *(∼5 min)*

The following image illustrates the transformation of the unit cube by the matrix

$$\begin{bmatrix} 3 & 1 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

This volume is equal to which of the following areas?

(a) $\det \begin{bmatrix} 3 & 1 \\ 1 & 1 \end{bmatrix}$ 　　　(b) $\det \begin{bmatrix} 3 & 1 \\ 1 & 0 \end{bmatrix}$ 　　　(c) $\det \begin{bmatrix} 3 & 1 \\ 0 & 1 \end{bmatrix}$ 　　　(d) $\det \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Fact G.2.7

If column i of a matrix is $\mathbf{e}_i$, then both column and row i may be removed without changing the value of the determinant. For example, the second column of the following matrix is $\mathbf{e}_2$, so:

$$\det \begin{bmatrix} 3 & 0 & -1 & 5 \\ 2 & 1 & 4 & 0 \\ -1 & 0 & 1 & 11 \\ 3 & 0 & 0 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 5 \\ -1 & 1 & 11 \\ 3 & 0 & 1 \end{bmatrix}$$

Therefore the same holds for the transpose:

$$\det \begin{bmatrix} 3 & 2 & -1 & 3 \\ 0 & 1 & 0 & 0 \\ -1 & 4 & 1 & 0 \\ 5 & 0 & 11 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 3 \\ -1 & 1 & 0 \\ 5 & 11 & 1 \end{bmatrix}$$

Geometrically, this is the fact that if the height is 1, the base $\times$ height formula reduces to the area/volume/etc. of the $n-1$ dimensional base.

Section G.2
Section G.3
Section G.4

Definition G.3.5

Let $A \in \mathbb{R}^{n \times n}$. An **eigenvector** is a vector $\mathbf{x} \in \mathbb{R}^n$ such that $A\mathbf{x}$ is parallel to $\mathbf{x}$.
In other words, $A\mathbf{x} = \lambda\mathbf{x}$ for some scalar λ.

We call this λ an **eigenvalue** of A.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Observation G.3.6

Since $\lambda\mathbf{x} = \lambda(I\mathbf{x})$, we can find the eigenvalues and eigenvectors satisfying $A\mathbf{x} = \lambda\mathbf{x}$ by inspecting $(A - \lambda I)\mathbf{x} = \mathbf{0}$.

- Since we already know that $(A - \lambda I)\mathbf{0} = \mathbf{0}$ for any value of λ, we are more interested in finding values of λ such that $A - \lambda I$ has a nontrivial kernel.

- Thus RREF$(A - \lambda I)$ must have a non-pivot column, and therefore $A - \lambda I$ cannot be invertible.

- Since $A - \lambda I$ cannot be invertible, our eigenvalues must satisfy $\det(A - \lambda I) = 0$.

Module G

Math 237

Module G
Section G.1
Section G.2
Section G.3
Section G.4

Definition G.3.7

Computing $\det(A - \lambda I)$ results in the **characteristic polynomial** of A.

For example, when $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$, we have

$$A - \lambda I = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} = \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix}$$

Thus the characteristic polynomial of A is

$$\det \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix} = (1 - \lambda)(4 - \lambda) - 6 = \lambda^2 - 5\lambda - 2$$

Observation G.3.12

Recall that if a is a root of the polynomial $p(\lambda)$, the **multiplicity** of a is the largest number k such that $p(\lambda) = q(\lambda)(\lambda - a)^k$ for some polynomial $q(\lambda)$.

For this reason, the **algebraic multiplicity** of an eigenvalue is its multiplicity as a root of the characteristic polynomial.

Example G.3.13

If $A = \begin{bmatrix} 3 & 1 & -1 \\ 0 & 3 & 3 \\ 0 & 0 & -1 \end{bmatrix}$, the characteristic polynomial is $p(\lambda) = (\lambda - 3)^2(\lambda + 1)$.

The eigenvalues are 3 (with algebraic multiplicity 2) and -1 (with algebraic multiplicity 1).

Observation G.4.1

Recall from last class:

- To find the eigenvalues of a matrix A, we need to find values of λ such that $A - \lambda I$ has a nontrivial kernel. Equivalently, we want values where $A - \lambda I$ is not invertible, so we want to know the values of λ where $\det(A - \lambda I) = 0$.

- $\det(A - \lambda I)$ is a polynomial with variable λ, called the **characteristic polynomial** of A. Thus the roots of the characteristic polynomial of A are exactly the eigenvalues of A.

- Once an eigenvalue λ is found, the **eigenspace** containing all **eigenvectors x** satisfying $A\mathbf{x} = \lambda\mathbf{x}$ is given by $\ker(A - \lambda I)$.
